

Abstract

This invention relates to an arrangement for closing an opening of a motor vehicle, which is provided with a pane (12), a layer (14) of cement material which acts as a flat shatterproofing element being attached with one side securely to the pane, the other side of the layer of cement material being used to cement at least one attachment part (18, 20, 30, 32, 34) to the pane, the attachment part being a reinforcing element (18) for the pane, a retaining element (303, 32, 34) for connecting the pane to the vehicle body or an element (38) connected to the vehicle body, or a visor.
